

Many people have been asking for a way to crack the "Imposition Studio 483" case, and I'm happy to say that there is not only a solution available but also one that you can use in less than 5 minutes! The idea came from reddit, an online message board where anyone can post any topic under the sun without question. Someone stated in a comment thread about this particular case: This is an interesting problem because it's so easy to find the solution. All you have to do is give it a try. It's something I've never seen before or heard of anyone mention before. I will admit that if you're not experienced with computers and software, it may be a little intimidating to start, but all you need to know is the basic knowledge of Microsoft Windows. Here's what you need to do: 1. Download Microsoft Virtual PC (previously named as "Microsoft Virtual PC for Windows" recommended if you want the 64bit version) and follow the instructions after installation. Make sure you choose "Install VPC with networking support". 2. Once you've finished installing and running the program, create a new virtual machine (from this point on I'll refer to it as VM). Read the warning that it gives you, then click "OK". 3. You will be asked to connect to your computer's network. If you're running Windows 7 or Vista, chances are that you're already connected. For Windows XP, you will need to connect with an Ethernet cable, but if you have a wireless adapter, windows 7 or Vista should automatically detect it during the installation of Virtual PC. Just double check in your network settings by opening up Control Panel. Once this is done, return back to Virtual PC and click on "Next". 4. Now you will be asked where to install into on your physical hard drive/computer. Windows XP will take up about 3.5GB onto your physical disk while Windows 7 or Vista should take up about 5-6GB worth of space. You can choose to install this software into a hard drive, an ISO (read below on how to make one), or choose the option "Install into a virtual hard drive file" and then click "Next". 5. You can name it whatever you like, but I suggest choosing something that describes the purpose of the VM (for example, I named mine "Virtual Imposition Studio" because it's for use with the program Imposition Studio). This virtual computer is your own personal computer, so feel free to put whatever you like onto it. 6. Now that the name is decided on, you will need to decide where to install the VM onto. Windows XP or Vista work with a hard drive, while Windows 7 or 8 should work with a .iso. For both cases, you will have the option to either burn it onto an actual CD/DVD through a disk burner of your choice, or you can choose "Copy the ISO file to disk" and then click "Next". 7. If you're getting the error of "The USB device \\Device\\HarddiskVolume3 doesn't appear to be working properly" then select your choice for option "Install from CD/DVD" and then click "OK".
